KEYNOTE SPEAKER 1

Joachim Fuchs

Head of the System Modeling and Functional Verification
The European Space Agency, Netherlands
Joachim.Fuchs@esa.int

Mon., June 27, 8:30 – 10:AM Room: Amazon

Title: Modeling and Simulation for Complex Design and Verification

Abstract

Modeling and simulation is often mentioned together. It is obvious that modeling is required to get to simulation, but there is also modeling which does not necessarily result in simulations, in particular dynamic simulations. Models are in that case an essential part of the design process and the formalization of the engineering information for different purposes. The presentation will highlight the uses of modeling and simulation in the system development lifecycle for complex space systems, addressing the uses in the design and development process as well as the application for the design and system verification. It will cover aspects such as modeling methodologies (including cross-sectorial issues), simulators and related testbenches, system of system modeling and some related standardization activities in the space domain.

Biography

Joachim Fuchs is presently Head of the System Modeling and Functional Verification Section of the European Space Agency. In this function he is providing support to many European Space projects in the domain of system engineering methods and tools, system verification and associated tasks. He is defining technology and methodology developments in the area of model-based system engineering (MBSE) and System of Systems/Enterprise architecting, linking it also to relevant standardization activities and harmonization of related activities between ESA and European Industry.

Rear Admiral of the Marine Engineering Service Klaas Visser was born on the island of Marken on 14 November 1956. In 1975, he was accepted as a midshipman to the Royal Naval College in Den Helder. From 1978 to 1992, he held all technical positions that exist on board submarines, including that of Head of the Engineering Service and the land staff of the Submarine Service. In the early 1990s, he was involved in the operational introduction of the Walrus-class submarines. In 1988, he obtained his Mechanical Engineering degree from the Technical University of Delft, with Marine Diesel Engines as his major subject. After 1992, he served as Head of the Engineering Service of the air defense frigate HNLMS Witt e de With, in which capacity he was involved in the deployment of Standing Naval Force Atlantic in 1993, as part of operation Sharp Guard in the Adriatic Sea during the Balkans conflict. In 1995, by then holding the rank of commander, he was posted to the Directorate of Materiel of the Royal Netherlands Navy, where he formed part of the design team of the Air Defense and Command Frigates (LCF). Following this period, he became Head of the Platform Management office. From 1997 to 1999, Commander Visser held the position of Head of the Engineering and Weapon Engineering Service aboard the first Landing Platform Dock, HNLMS Rotterdam, in which capacity he was involved in the operational deployment of that ship as part of operation Allied Harbor during the Kosovo war. In 1999 he was stationed in The Hague, as Head of the Plans/Operations Office of the Navy Staff. In 2000, he was promoted to the rank of captain of the Marine Engineering Service and assumed the position of Head of Projects and Parliamentary Affairs of the Defense Staff. In 2002, he was posted to the Naval Maintenance and Service Agency in Den Helder, where he was tasked with the establishment of the Central Planning and Maintenance Management Division, which would integrate all account management, project management, system management and client-supplier relations of the Naval

Title: Risk Analysis and Simulation Modeling

Abstract

Probabilistic risk analysis has been rapidly growing over the past few decades and applied in sectors of nuclear energy, health care, transportation, homeland security, construction, financial systems and computing, among others. Risks exist in these fields due to accidents, natural disasters or terrorist activities, which are the so-called safety and security risks. The ultimate objective is to manage and mitigate risks due to unintentional or intentional incidents while allocating resources under uncertainty and ensuring compliance.

The term *risk* is used to mean different things in different fields of the society. It is just the probability of occurrence in healthcare, variance in finance, number of fatalities in transportation and loss with some chance in other fields. The basic method of analysis has been to identify scenarios to describe possible pathways to unwanted events. Each scenario has a probability of occurrence and associated consequences such as human fatalities, environmental impact, property damage and others. In a risk analysis, considering potential instigators, situations and incidents, a risk algorithm evaluates all possible risks that are typically dynamic across time and space. This is a numerically demanding process that needs to represent the operation of the system of interest with high degree of accuracy.

Simulation modeling has become the sought-after tool in model-based probabilistic risk analysis since large-scale, high-fidelity models are typically needed to represent systems of interest. A successful model-based risk analysis requires a combined approach of a mathematical risk model working in concert with the simulation model. The simulation model passes spatial and situational information to the risk model to evaluate the associated risks at every so often.

In this talk, we will focus on the maritime domain with risks involved in ports and waterways and the ones in the Strait of Istanbul in Turkey and Delaware River in the U.S, in particular.

A high-fidelity simulation model will be discussed to account for all potential events (e.g., vessel collisions, groundings, ramming, spills, and others in safety related scenarios) along with a range of consequences. Construction of a risk profile over time and space will be presented to discuss ways to mitigate risks.

For example, ports and waterways experience dynamic risks with surges and severe highs and lows in maritime traffic, and water and weather conditions. It is important to develop sound risk-mitigation policies to minimize potential disruptions to the global supply.

It is clear that problems of our times and the requisite decision making are increasingly complex requiring sophisticated approaches and placing high expectations on the tools and modeling capabilities. In view of this, we will finalize the talk with a discussion on the challenges in developing effective large-scale, high fidelity simulation models.

Biography

Dr. Tayfur Altiok has years of experience in practicing and teaching simulation modeling and analysis. Title: Performance of Grids and Clouds – Challenges and Research Directions

Abstract

Computational and data grids and clouds are large-scale distributed systems used for serving demanding jobs. Their performance became more important due to the tremendous increase of users and applications.

Because of the nature of these systems, there are important issues that must be addressed, such as: efficient scheduling, resource management, load balancing, energy efficiency, reliability, security and trust, cost, availability, quality.

Grid scheduling manages the selection of resources for a job, the allocation of jobs to resources and the monitoring of jobs execution. In large-scale heterogeneous distributed systems, such as grids, energy conservation is an important issue and can take place at multiple levels; some examples are server level, cluster level, site level and grid broker level.

Cloud computing evolves from grid computing; it provides users the ability to lease computational resources from its virtually infinite pool for use in HPC. If cloud computing is going to be used for HPC, appropriate methods must be considered for both parallel job scheduling and VM scalability. The scheduling algorithms must seek a way to maintain a good response time to leasing cost ratio. Furthermore, data security and availability are critical issues that have to be considered as well.

The performance evaluation of grids and clouds is often possible only by simulation rather than by analytical techniques, due to the complexity of the systems. Simulation can provide important insights into the efficiency and tradeoffs of scheduling in complex distributed systems, such as grids and clouds.

Simulation Councils, Inc. became The Society for Computer Simulation which is where we derived the acronym SCS. Today, we still keep the familiar SCS acronym as a part of our identity, but have given it a new and more relevant meaning: Simulate, Create, Serve. This SCS is not only who we are, but also who we serve.

SCS is the only technical Society dedicated to advancing the use of modeling & simulation to solve real-world problems. SCS is the principal technical society devoted to the advancement of simulation and allied computer arts in all fields. The purpose of SCS is to facilitate communication among professionals in the field of simulation. To this end, SCS organizes meetings, sponsors and co-sponsors national and international conferences, and publishes the SIMULATION: Transactions of The Society for Modeling and Simulation International and the Journal of Defense Modeling and Simulation magazines.
